How Team 4 used AI

70 logged steps, 29 AI errors caught. Every step lists what we kept and how we checked it. No personal data, keys or whole datasets were given to the AI. Source: work/AI-LOG.md.

Use log

Thu AM · 1 Understanding case and data · Claude Code
Asked: Check prep repo for personal data before start
Kept: Repo clean; kept as is
Checked: Grep of files + git history, read the results

Thu AM · 1 Understanding case and data · Claude Code
Asked: Turn personal checklist into a team overview PDF
Kept: TEAM-OVERVIEW.pdf (Team 4)
Checked: Rebuilt after reading Annexes 1, 3, 4, 5 (first version relied on checklist only)

Thu AM · 5 Desk research and sources · Claude Code (web search + fetch)
Asked: Background on July 2021 floods in Wallonia
Kept: WALLONIA-2021-TEAM4.pdf, key figures from Walloon Gov press release 4 Jul 2022
Checked: Opened the primary PDF; unopened sources marked "verify"

Thu AM · 1 Understanding case and data · Claude Code
Asked: Can our teammate's GEV / extreme value idea be used?
Kept: No own GEV fit: data has no discharge/rain time series; use EFAS RP10/100/500 maps (Annex 2)
Checked: Listed dataset files; Annex 2 fact sheet

Thu AM · 2 Loading and preparing data · Claude Code
Asked: Read real layer/column names before coding
Kept: Field names, CRS (all EPSG:4326)
Checked: Metadata read from the files, not guessed

Thu AM · 3 Analysis and code · Claude Code
Asked: Script: observed 2021 flood vs EFAS return-period zones, buildings + people
Kept: work/analysis/vesdre_rp_gap.py (first run, AOI01)
Checked: 15 helper tests pass; building count cross-checked with a second method

Thu AM · 5 Desk research and sources · Claude Code (web search + fetch)
Asked: Do long river-flow records exist for a GEV? Any soil data?
Kept: Wallonia Annexe F (official GEV fits incl. July 2021 peaks); Meuse records (RWS, GRDC); EU-SoilHydroGrids as optional context
Checked: Annexe F PDF opened and read; peaks read off charts = approximate

Thu midday · 8 Policy tool · Claude Code
Asked: Merge teammate's Streamlit "flood impact card" data into our Android/web map
Kept: work/analysis/build_app_layers.py: municipality, RP10/100/500, observed 2021, gap and gauge layers; 4-step story
Checked: Teammate's 156 vs our 158 buildings in the 2021 footprint (AOI01): two independent methods agree

Thu midday · 5 Desk research and sources · Claude Code
Asked: Official coordinates for the Annexe F gauges
Kept: 2 gauges (Spixhe L6790, Theux L5860) from the AQUALIM geoservice; Meuse/Ourthe gauges left out (no official coordinates found)
Checked: Queried the official Wallonia geoservice, no coordinates guessed

Thu midday · 8 Policy tool · Claude Code
Asked: One app, two sides: policy makers + residents (alerts, shelter info)
Kept: Mode switch; residents side = public layers + official Crisis Centre advice/links + labelled DEMO notification; no shelter points (none in data, only authorities can name them)
Checked: Official URLs checked (one 404 replaced); advice quoted from Crisis Centre pages

Thu midday · 8 Policy tool · Claude Code
Asked: Build web page + Android APK
Kept: dist/policy-tool.html (3.8 MB), dist/policy-tool-debug.apk (2.1 MB)
Checked: Build succeeded; web page served locally; visual check on phone still to do

Thu midday · 8 Policy tool · Claude Code
Asked: Code review + build APK v0.1
Kept: 3 fixes: demo alert sent right after permission grant; no mode switch in the separate public edition; script-order note
Checked: APK inspected: version 0.1, 7 layers, notification permission, residents content bundled

Thu PM · 8 Policy tool · Claude Code
Asked: v0.2: role choice at start, residents' essentials every open, verified messages policy → residents, water/electricity/gas status per municipality (mayor's idea)
Kept: Demo relay server (code-protected, in memory, laptop + USB); essentials quoted from Crisis Centre "Inondation pluviale" page; statuses never pre-filled
Checked: Relay tested with curl (wrong code 403, bad input 400, CORS); all page element ids cross-checked; APK inspected (v0.2, localhost-only http)

Thu PM · 7 Recommendations and brief · Claude Code
Asked: 2-page concept sheet for the Communicator (pitch, trust points, words to use/avoid, real vs demo)
Kept: work/CONCEPT-TEAM4.pdf
Checked: Only figures already traced to opened sources; layout checked on rendered pages

Thu PM · 8 Policy tool · Claude Code (Remotion)
Asked: v0.3: 18 s "what to do" animation for residents (skippable, then 4-tile card) + GPS municipality
Kept: motion/ project, media/essentials-en.mp4 (430 KB); FR/NL/DE left empty until a native speaker writes them; location used on the phone only
Checked: 6 stills reviewed before render (water line lowered after review); MP4 probed (18.0 s, 720×1280, no audio); point-in-polygon tested (Visé, Esneux found; Brussels outside → manual)

Thu PM · 8 Policy tool · Claude Code
Asked: v0.4: A/B test apps (video vs 3-line text), easy-read mode for elderly/disabled residents (big text, contrast, read aloud), crisis chat between policy makers
Kept: Two side-by-side APKs ("Flood app A/B"); essentials cut to 3 lines; chat private (code needed to read and write), senders are roles not names
Checked: Chat endpoints tested with curl (403 without code); both APKs inspected (id, label, video present/absent, variant flag)

Thu PM · 8 Policy tool · Claude Code
Asked: v0.5: integrate teammate's flood-impact v2 + quick-info screen for policy makers
Kept: Flood zones without permanent water; residents in 100-year zone as a range (census vs GHS-POP) + 65+; candidate shelters and flooded roads on the policy side only (teammate's own rule: candidates are not official); OSM/Eurostat/Infrabel credited
Checked: Visé values match teammate's data (4,591 buildings; 4,800-5,120 residents); source URLs checked; residents' layer list verified (no shelters); 3 APKs inspected

Thu PM · 4 Maps and charts / 8 Policy tool · Claude Code (+ built-in dataviz skill)
Asked: v0.6: "closest shelter" for residents, simplicity pass, colour check
Kept: Closest 3 candidate shelters computed on the phone (dry in 500-yr model and in 2021; no hospitals, no open-air pitches; "not official" warning); 3 big resident actions; secondary sections folded; map colours replaced after the palette validator failed the old ones
Checked: Validator run (old overlay set FAILED: two near-identical purples; new set passes); nearest-shelter tested on Visé/Esneux; 3 APKs inspected

Thu PM · 8 Policy tool · Claude Code
Asked: v0.7 for the presentation: location useless outside Wallonia; map unclear
Kept: DEMO location (Visé) offered only when the real location is outside the data area or unavailable, labelled DEMO; grey basemap; municipalities as light outlines; gap layer off at start; map opens on the data area
Checked: Layer defaults listed from the build; basemap tile URL checked; syntax and element ids checked

Thu PM · 8 Policy tool · Claude Code
Asked: v0.8: video on the first app open, before "Who are you?" (strong first minute for the demo)
Kept: Plays once on first open, then a "▶ What to do" button; a resident choosing right after gets the card without a second play; later resident opens still play it; text A/B build unchanged
Checked: Syntax check; flow tested in the Android emulator (see next rows)

Thu PM · 2 Loading and preparing data / 8 Policy tool · Claude Code
Asked: Safe access to the challenge data; local database for app messages?
Kept: work/DATA-ACCESS.md: keep Annex 1 Option C (local copy, no credentials); app never connects to the bucket. Relay now keeps messages/status/chat in local SQLite (git-ignored, --reset before demo), code only in env variable
Checked: curl tests on a scratch database: 403 wrong/missing code, 400 empty text, CORS header, data still there after restart, empty after --reset, code not found in the database file, SQL-like text stored as plain text

Thu PM · 5 Desk research and sources · Claude Code (subagent, web search + fetch)
Asked: Evidence-based UI/UX for apps used in a crisis
Kept: work/CRISIS-UX-TEAM4.md: 8 principles (CDC CERC, START/DHS 2014 alert study, W3C/WCAG 2.2, Android accessibility, NN/g, Belgian Crisis Center); 6 leads not opened left out
Checked: Each principle only from a page/PDF actually opened, passage quoted; caveats noted (US sources, 2014)

Thu PM · 8 Policy tool · Claude Code
Asked: Apply the crisis UX principles to v0.8
Kept: Named sender on every message (relay refuses a message without one); composer hint "what to do, why, where, by when; mark what is not known"; inbox line "check on BE-Alert"; 48 px language buttons; "Stay safe" heading renamed "Official advice" (our no-"safe" rule)
Checked: Contrast ratios computed (WCAG formula): status tiles 7.2-8.5:1, muted text 6.1-6.8:1; syntax checks; emulator re-test

Thu PM · 6 Validation and testing / 8 Policy tool · Claude Code (Haiku subagent, Android emulator)
Asked: Test first open, resident/policy flows and map clarity on a clean emulator
Kept: Flow works (video on first open, no second play, Watch button, video again after 2 min); found: invisible easy-read heading, DEMO button off-screen, two similar oranges on the map, white screen while loading, template text in the policy panel
Checked: Screenshots for every step; Claude re-checked the key screenshots itself

Thu PM · 8 Policy tool · Claude Code
Asked: Fix the emulator findings
Kept: Heading colour, scroll to DEMO button, story step 1 without municipality shading, navy start screen (Android theme + first-open class)
Checked: Re-tested in the emulator: colours sampled from screenshots during launch (navy from the first frame), heading visible

Thu PM · 6 Validation and testing · Claude Code (Android emulator)
Asked: Database end to end: relay (SQLite) to phone over adb reverse
Kept: Message with sender: notification + inbox; status for Visé: coloured tiles + note + notification; still there after app restart
Checked: Emulator screenshots + Android notification list read back

Thu PM · 5 Desk research and sources / 8 Policy tool · Claude Code (subagent, web)
Asked: Mayor's request: residents had to visit 3 websites for water/power/gas
Kept: Operator + fault number + outage page per tile for Visé, Liège, Esneux, Pepinster (RESA power+gas; CILE water, SWDE for Pepinster); other municipalities: "see your bill or ask your municipality"
Checked: Operators from the regulator CWaPE (postcode search) + CILE/SWDE lists; numbers copied from operator pages; tap opens the dialer with the right number (emulator)

Thu PM · 3 Analysis and code / 8 Policy tool · Claude Code
Asked: Teammate's flood-impact v3: what fits the Android app?
Kept: Residents: closest shelter by a dry walking route (1-in-500-year model, from the teammate's per-municipality export) with walking minutes, no-stairs version, rough capacity, wheelchair info; straight-line list only outside housing cells. Policy side: 28 municipalities without a modelled river shown grey as "not modelled, not no risk"; share aged 80+ (Statbel); shelter capacity + wheelchair in popups

Checked: Visé DEMO point: our app's cell, shelter (Athénée de Visé) and minutes (4 / 5 no-stairs) identical to the teammate's own file; the teammate's "56,486 people without a dry route" NOT recomputed (no parquet reader here)

Thu PM · 8 Policy tool · Claude Code
Asked: v1.0 build
Kept: versionName 1.0, video + text APKs, single HTML with the route data inlined
Checked: Build checks (node --check in the build), file sizes, TOOL_ACCESS present in the HTML; full emulator test next row

Thu PM · 6 Validation and testing · Claude Code (Haiku subagent, Android emulator)
Asked: Full v1.0 test: first open, dry-route shelter, no-stairs, utility tiles + dialer, database messages/status, easy read, policy story
Kept: Passed: video flow, shelter card (Athénée de Visé, 4 / 5 min), Open in Maps, operator tiles, dialer, status + message from the relay, easy read, story steps. Found: page under the Android 15 status bar, buttons under the gesture bar, stale "location not available", details opening out of view, resident buttons on the policy side, legend + story card covering the phone map. The emulator itself crashed (graphics driver, signal 11 while decoding video); restarted with guest GPU
Checked: Screenshots reviewed by Claude; crash cause read from the emulator log

Thu PM · 8 Policy tool · Claude Code
Asked: v1.0 polish from that test
Kept: Navy safe-area frame around the page (Android), hint cleared on choice, sheet-only scrolling, hidden resident buttons on the policy side, smaller phone legend/story card, story step 1 zoomed on the Meuse, step 2 with municipalities to tap, numbers no longer split, status notifications titled separately
Checked: Each fix re-checked in the emulator with screenshots (start screen, story steps 1-2, tap on Welkenraedt shows "not modelled")

Thu PM · 8 Policy tool · Claude Code
Asked: Rename to walert with the team's logo; ship one APK (video)
Kept: Logo and name designed by the team (not AI-made here). Claude Code wrote work/make_icon.py: crops the mark from the team's logo sheet into the Android launcher icon (adaptive, white background) and puts the full logo on the start screen; app label, page title and single HTML now say walert; one final APK dist/walert-v1.0.apk + walert-v1.0.html (text A/B variant kept in code, not shipped)
Checked: Icon crop viewed (first crop had a teal sliver of the wordmark, fixed); aapt: label walert, versionName 1.0-video, adaptive icon; emulator: launcher icon + name, first-open video, logo above "Who are you?"

Thu PM · 8 Policy tool · Claude Code
Asked: Remove "Aa" from the Easy read button
Kept: Button now says "Easy read"; walert rebuilt and reinstalled
Checked: Rebuilt APK installed on the emulator

Thu PM · 6 Validation and testing · Claude Code
Asked: Why does the phone not reach the message server; connect without USB
Kept: Cause: server not running + no adb link (APK installed without USB). Wireless debugging tried: laptop could not reach the phone on the event Wi-Fi (devices blocked from each other). Decision (team): demo without live messages today, fix tomorrow (phone hotspot)
Checked: Port test from Windows to the server (reached) and to the phone (timed out)

Thu PM · 9 Communication · Claude Code
Asked: 1-minute talk on the Android side, for policy makers
Kept: Script in work/TALK-1MIN.md: video, 3 buttons (shelter, water/power/gas, messages), easy read, location stays on the phone; Q&A cautions (shelters not official, demo places only)
Checked: Only facts already in the app; "28 of 66 not modelled" recounted from the app data for the earlier version

Thu PM · 9 Communication · Claude Code
Asked: 1-2 minute pitch with the phone in hand (full demo tomorrow), as a PDF
Kept: work/PITCH-TEAM4.pdf (from work/make_pitch_pdf.py): problem (a mayor: three websites for water, power, gas), walert connects policy makers with their residents: what to do and where to go + the 3 utilities in one place for residents, the full picture for policy makers, policy makers message residents with a named, verified sender
Checked: Only facts already in the app or the AI-LOG; preview of the page checked

Thu PM · 9 Communication · Claude Code
Asked: Pitch v2: review all of v1, highlight the most important, catchier; challenge data now, can grow to Belgium + EU
Kept: Policy makers first (2021 vs 100-year zone, the Visé gap, data gaps, verified messages, crisis chat), residents (closest possible shelter by a route avoiding flood zones, messages, utilities), "built to grow" with honest caveats in the notes, closing on the logo's tagline
Checked: Every claim matched to a v1 feature or story step (content.js); death toll removed at the team's request; page preview checked

Thu PM · 9 Communication · Claude Code
Asked: Pitch v3: spoken text only (jury comes to the table); connect communities; computer version exists but phone first in a crisis; risk without walert (local communication, not big data)
Kept: work/PITCH-TEAM4.pdf, one page, about 280 words; tap cues and stage notes removed; one repeated line cut
Checked: Page preview checked; "not missing big data" kept as the team's own argument, not presented as a sourced fact

Thu PM · 10 Delivery · Claude Code
Asked: Prepare the GitHub upload (no git credentials on this laptop: website upload)
Kept: upload-v1.0/ refreshed: final APK + HTML, source, motion, work (AI log, pitch), team logo, new top-level README; copied to Windows Downloads as walert-github (94 files, 27 MB, under GitHub's 100-file web upload limit)
Checked: Scan for keys, emails, names, .db/.env files: only placeholders found ("choose-a-code", "...@european-ai-challenge.com")

Thu PM · 9 Communication · Claude Code
Asked: Pitch for the 1st speaker (computer side), broad, handing over to the phone side; Verviers instead of Visé in the phone pitch
Kept: work/PITCH-COMPUTER-TEAM4.pdf (about 215 words): full picture, municipality numbers, shelters, Theux gauge, grey = not known, European data, hand-over to the phone. Phone pitch: Verviers used as the data-gap example (0 buildings in the 2021 satellite footprint), not as "flooded outside the zone"
Checked: Every claim checked against the app data: Verviers 0 buildings in the 2021 footprint; wheelchair info known for only 49 of 2,346 shelters and capacity is an assumption, so both lines softened

Thu PM · 9 Communication · Claude Code
Asked: Phone pitch edits: Verviers residents in the opening, general data-gap example, location line out, French slogan
Kept: work/PITCH-TEAM4.pdf rebuilt (Anticiper, coordonner, protéger)
Checked: Team to confirm the three-websites remark applies to Verviers (it came from a mayor)

Thu eve · 8 Policy tool · Claude Code
Asked: v1.1 onboarding (owner's request): language first, then the video in that language, then "Who are you?"; "I live here" opens in place with ONE "Elderly or disabled" switch (big text + read aloud + routes without stairs) instead of a 3rd start button and a separate header button; language and switch remembered on the phone
Kept: app.js/index.html rewritten for the start screen and the "In a flood" card; Android read-aloud now uses the chosen language's voice (falls back to English)
Checked: Headless Chromium click-through at phone and laptop size, light + dark; emulator first open; Haiku sub-agents re-ran the checklist on the emulator and on the single HTML

Thu eve · 8 Policy tool · Claude Code
Asked: Essentials video in FR/NL/DE/EN (was EN only)
Kept: The v1.0 English lines (plain words based on the National Crisis Centre's flood advice) translated into FR/NL/DE with the Centre's vocabulary from its own page in each language (opened 29 Oct 2026); source line now says "based on"; renders per language with font fitting
Checked: Stills of every beat in all 4 languages viewed for overflow and accents; a teammate who speaks FR/NL/DE checks the text before the demo

Thu eve · 8 Policy tool · Claude Code
Asked: Policy side: story card closes after step 4 ("Done ✓" → "▶ Briefing" pill to replay); intro shortened to 3 points with "Start the 4-step briefing"; visual redesign in the logo's colours (navy header with the walert mark, cards, switches, step dots)
Kept: style.css rewritten with colour tokens

Checked: Screenshots reviewed; text contrast measured 5.4:1 to 11.8:1 (WCAG ≥ 4.5:1) at both sizes and both colour schemes

Thu eve · 9 Communication · Claude Code

Asked: Live demo guide: work/DEMO-GUIDE-TEAM4.pdf (setup commands, 5-minute run with a screenshot per step, fallbacks, likely questions)
Kept: Built by work/make_demo_pdf.py from screenshots taken by work/demo_shots.js against the real app with the demo server running
Checked: Pages rendered to PNG and read; every command copied from the project's own scripts

Thu eve · 8 Policy tool · Claude Code

Asked: v1.2: the teammate's flood-impact v3 analysis (their PC/Streamlit admin view) inside walert's policy side: municipality picker sorted by exposure, scenario chips, 7 tabs (overview, shelters with CSV, people, roads & rail, compare with 2021, buildings, data & limits), map layers per municipality (flooded roads/rail, shelter footprints, 250 m squares, walking access); key numbers computed instead of placeholders
Kept: work/analysis/build_impact.py exports aggregates from their app_data with the same expressions as app/app.py (line references in the code): 6.7 MB in the app instead of their 44 MB working files / 6 GB raw rasters
Checked: check_impact.py recomputes Visé, Pepinster, Esneux × 4 scenarios independently (cards and tab tables): all match; key numbers equal the sum of the 66 cards; browser test renders all 66 × 4 × 7 tabs with no blanks or errors

Thu eve · 8 Policy tool · Claude Code

Asked: Privacy split (owner's choice after we explained the teammate's rule): residents see buildings only per 250 m square, no count below 5 buildings; individual building points only on the policy side after the verification code (in the demo the file is still inside the app: said in the limits)
Kept: Residents layer built from aggregates only; points loaded on demand after the relay accepts the code
Checked: Tested: wrong code refused, right code shows points; residents page never loads the points file

Thu eve · 8 Policy tool · Claude Code

Asked: Demo never opens empty: relay --seed-demo loads a made-up DEMO water/power/gas status for the 4 demo municipalities and one DEMO message; tiles say 'demo server offline' instead of plain grey
Kept: Every seeded line says DEMO; nothing claims to be real network information
Checked: Phone test: tiles filled for Visé with operator call buttons; inbox shows the DEMO message

Thu eve · 6 Research · Claude Code (research sub-agent)

Asked: Which water, electricity and gas operator serves each of the 66 municipalities, with official fault numbers
Kept: Electricity/gas from the regulator CWaPE's 'Trouver mon GRD' for every postcode; water from each distributor's own list of communes, cross-checked with the SPW water-zone map; the agent's caveats kept (two water operators in some towns → 'check your bill'; communal lines not all 24/7 → labelled 'Water incident')
Checked: The 4 municipalities checked by hand earlier (Visé, Liège, Esneux, Pepinster) matched; every number links to its source page; unconfirmed items left as 'see your bill'

Thu eve · 9 Brief · Claude Code

Asked: Five figures for the policy brief in the Annex 6 example style (blue scale, grey = not modelled, callouts)
Kept: fig1 map share of buildings in the 1-in-100 zone; fig2 top-10 residents (range of 2 population sources); fig3 three scenarios; fig4 2021 satellite coverage and buildings outside the model zone; fig5 residents without a dry route to a shelter candidate (work/make_brief_figures.py, CAPTIONS.md)
Checked: Numbers read from impact.js (already recomputed by check_impact.py); the script asserts the 1-in-100 totals equal the app's key numbers (64,366 buildings, 138,301 residents); every figure looked at after rendering

Thu eve · 10 Pitch · Claude Code

Asked: 68-second keynote intro film for the end of the pitch (Remotion), with real recordings of v1.2: emulator take for the phone, Chromium take for the policy side (work/record_keynote.js, motion/src/Keynote.tsx)
Kept: Three questions (where do I go, who do I call, who do I trust) answered by the three buttons; policy side with a push-in so it reads on a projector; no death toll, no "safe"

Checked: Frames checked at every beat; recording uses a separate freshly seeded relay so only the one DEMO message shows

Thu night · 10 Pitch · Claude Code

Asked: Keynote film v2 (72 s): policy makers first, all on the phone (laptop take dropped, it showed the teammate's design), resident side as a 4-shot montage, network of the 66 real municipalities, music-reactive motion
Kept: Music "Floating Cities" (K. MacLeod, incompetech.com, CC BY 4.0) picked by the owner's choice of source; track chosen by beat/loudness analysis (AI cannot listen), owner approves by ear; credit on the end card
Checked: Every number on screen read from impact.js / municipalities.gpkg (work/make_keynote_data.py); all chat and message lines start with DEMO; still at every beat checked

Thu night · 10 Pitch · Claude Code

Asked: Keynote film v3 (87 s, no music for now) after the owner's review: the app's own 18 s intro video after "66 municipalities connected", logo + slogan only at the end, bigger phones, the message arrives on the resident phone as a notification
Kept: Owner chose the order and the English intro video; music left out until the owner picks it by ear
Checked: Still at every segment; satellite switch and Send → notification checked frame by frame

Thu night · 8 Policy tool · Claude Code

Asked: Owner's phone feedback: (1) a play-icon screen flashed before the video, (2) 'What to do' replay took a main button, (3) 'Who are you?' stayed in English after choosing French
Kept: (1) transparent WebView default poster + navy background matched to the video's first frame, video fades in once playing (3 s fallback to the card); (2) main row = Closest shelter · Water, power, gas · Messages (with count), replay moved to a small link under 'Official advice'; (3) the start screen follows the chosen language (FR/NL/DE/EN strings in content.residents.js)
Checked: (1) emulator screen recordings before/after, frame by frame: grey play icon for ~0.4 s before, none after; (2)(3) Playwright at phone size in light, dark and easy mode, all 4 languages; native-speaker check of the new FR/NL/DE strings still to do

Thu night · 8 Policy tool · Claude Code

Asked: Owner's phone feedback: (4) a phone on its own showed 'demo server not reachable' and empty water/power/gas; (5) the shelter panel repeated a 'No stairs' box already chosen in onboarding
Kept: (4) the DEMO scenario (statuses + one message) built into the app, used until the laptop's demo server answers, every line marked DEMO; (5) box removed, the route follows the 'Elderly or disabled' setting, one-line note when it is on
Checked: Playwright with an unreachable server address and with the live server; setting switched while a route is shown: route recomputed (4 → 5 min step-free)

Thu night · 8 Policy tool · Claude Code

Asked: Map visuals (owner: the grey map is not appealing; take tips from the teammate's PC version, keep it simple)
Kept: PC version uses CARTO maps + satellite; CARTO now needs an API key (tested: 'API key required' tile), so: Esri topographic as default (relief shows the valleys), a 'Satellite / Map' switch like the PC's layer choice, legend folded to one button on phones, key-number range no longer broken mid-number
Checked: Tile services tested without a key; screenshots laptop + phone, topo and satellite; no console errors

Thu night · 8 Policy tool · Claude Code

Asked: Header: owner proposed dropping the title, version and subtitle from the top bar to give the map more room
Kept: One slim bar (walert mark, role, Help, Switch role); title kept for screen readers and as the page title; version moved to the end of the panel; header buttons kept on one line on small phones; easy mode: zoom buttons no longer underlined, legend button normal size
Checked: Measured bar height: 54-66 px (was about 130 px on a phone); screenshots at 360, 412 and 1440 px, normal and easy mode; no overflow, no console errors

Thu night · 7 Recommendations and brief · Claude Code

Asked: Fill the official AI sheet (Annex 7) from everything logged, incl. the teammate's AI-built pipeline and the owner's corrections
Kept: work/AI-SHEET-TEAM4.docx (make_ai_sheet.py, the template's own layout): tools, 8 stages with ticks and sentences, help/letdown, 5 errors, 3 of the owner's own prompts, verification, limits

Checked: Every statement traced to an AI-LOG row or the teammate's PLAN/IMPROVEMENTS notes; scanned for names and personal data; team to read and adjust the ticks and section 2

Fri AM · 8 Policy tool · Claude Code
Asked: Keynote film in 3 sound versions (owner: mix of sound design and music): A own synthesised effects only, B Floating Cities + effects, C Clean Soul (Kevin MacLeod, CC BY 4.0, tempo +3%) + effects
Kept: motion/out/walert-keynote-A-sound/B-floating/C-cleansoul.mp4, sound-compare.mp4 (work/make_sfx.py, test_sound.py)
Checked: work/SOUND-TEST.md: loudness, peak, clipping, frames, ping/tap/whoosh timing by matched filter, beat vs cuts; owner chooses by ear

Fri AM · 8 Policy tool · Claude Code
Asked: Short keynote cut ≤ 45 s for after the team's talk (owner: cut the fluff, sound A, keep the rain at the start): policy → Send → resident → logo
Kept: motion/out/walert-keynote-short-A.mp4 (35.3 s, KeynoteShort composition)
Checked: work/SOUND-TEST-SHORT.md: duration, ping/tap/whoosh on their frames, loudness; contact sheet of 12 stills; key number reaches 138,301 before the cut

Fri AM · 8 Policy tool · Claude Code
Asked: v1.3: map moves (briefing steps, municipality pick, resident shelter route) land in the visible part of the map above the panel and the briefing card (owner saw areas half cut off on the phone)
Kept: template/dist/walert-v1.3.apk/.html, upload-v1.3/
Checked: Playwright phone 412×860 old vs new screenshots (4 steps + Visé), laptop 1440×860 and resident route: no page errors; fix found in the built HTML and inside the APK

Fri AM · 10 Pitch · Claude Code
Asked: How the jury grades (Annex 4) and how long the live phone part is
Kept: 4 equal criteria, no point scale in Annex 4 (ask the organisers if a scale matters); timing per part; keep the hand-over to the named-actor part on time
Checked: Read against the team's copy of Annex 4 and our pitch script

Fri AM · 7 Recommendations and brief · Claude Code
Asked: Our own prediction model may not work: what angle, and can we say it could run on a locally hosted open-weight model?
Kept: Advice: walert is the last-metre layer that relays official forecasts (EFAS already sent flash-flood notices for Liège 24-36 h ahead); show our own model only if checked against July 2021, otherwise name it as a limit; a local open-weight model only as an untested deployment option, and a human always presses Send
Checked: EFAS fact checked in our research notes (JRC135679); the team decides the final wording

Fri AM · 10 Pitch · Claude Code
Asked: Timing for the new order: team talk 3 min, intro, 35 s film, resident live demo, teammate's PC demo
Kept: About 2 min for both demos; 2 taps on the phone; Send pressed from the PC during the resident demo; the 3-min talk must cover actor, limits and responsible AI
Checked: Team rehearses with a stopwatch

Fri AM · 8 Policy tool · Claude Code
Asked: v1.4: we have no prediction model, so the Recommendation box said nothing; replace it with the 'Priority issues' layout of the teammate's latest flood-impact version
Kept: template/dist/walert-v1.4.apk/.html: per municipality and scenario the teammate's high/medium/low issues with text and action (high group open), and with no municipality chosen the top 8 of 66 by high-priority issues + CSV of all 66; empty Recommendation box hidden until a named actor is filled in; data/risks.js written by build_impact.py, now reading the latest version
Checked: Our other data rebuilt from the latest version is byte-identical (key numbers unchanged); Visé 1-in-100 (4/6/2) and the top 3 (Esneux, Liège, Comblain-au-Pont) recomputed from risks.parquet: same; Playwright phone + laptop and residents side: no page errors; APK contents checked; not yet tested on the phone

Fri AM · 8 Policy tool · Claude Code
Asked: v1.5: 'Crisis chat' renamed 'Crisis center'; Crisis center and Inform residents as the main actions; water/electricity/gas had to be scrolled sideways on a phone; intro video with sound; a 'No internet' fallback (likely jury question)

Kept: Inform residents and Crisis center moved up, one code unlocks both, preview of what residents get, confirm step, 1-SMS length hint; one row per utility with 3 buttons (fits 360 px); intro sound from the film's own sound effects, falls back to muted; offline screen: 112, the municipality's utility numbers, closest dry shelter by GPS, last alerts, 'text my location' by SMS, BE-Alert sign-up. Correction to the v1.4 row: final v1.4 shows the top 10 + 'show all 66', the CSV button was dropped (download likely dead in the app)
Checked: Overflow probe at 360/412/430 px, relay round trip, offline Playwright run, emulator check; no new phone numbers added (diff checked)

Fri AM · 8 Policy tool · Claude Code
Asked: v1.5.1: show the team's named actor in the tool (same text as the brief), keep the UI clean; move the 'Background map needs internet' note onto the map; then test v1.5 on an Android emulator with a second AI agent
Kept: 'Our recommendation' box above Priority issues (actor shown, action and why folded; about 1/3 of the half-open panel on a phone); emulator run: 10 of 12 steps passed, no crash or JS error
Checked: Actor/action/why compared character by character with the brief; screenshots at 360/412/1440 checked by the owner's session; every QA failure re-checked by hand (see errors)

Fri PM · 8 Policy tool · Claude Code
Asked: v1.5.2: the Crisis center must read as the channel between policy makers; the key numbers had too much text
Kept: Crisis center summary 'Private channel between policy makers: mayors, province and crisis centre. Residents never see it.' + 'Coordinate here before you inform residents.'; Inform residents tagged 'To all residents' phones'; key numbers = value + short label, one 'Checked' line and one folded source instead of 3 repeats
Checked: Values identical to v1.5.1 (test), screenshots at 360/412/1440 checked; same test suite all pass

Fri AM · 7 Recommendations and brief · Claude Code
Asked: Check the teammates' policy brief, intro text and AI sheet; merge the two AI sheets into one
Kept: Brief: a fix list (18 items) and a corrected copy, the team chooses: EFAS and Copernicus times sourced (JRC135679, EMSR518), 3 facts we could not source marked [VERIFY], tool claims matched to the prototype (no live data or telemetry yet, shelter candidates not verified shelters), the app's key numbers and a Limits paragraph added, header picture 9.5 to 1.7 MB. One AI sheet: the teammates' file as base, the mobile side added per stage, 5 errors and 3 prompts chosen from both
Checked: Facts against our cited research notes (BRIEFING.md, RESEARCH.md); numbers against impact.js and risks.js; 2-page limit still to check in Word (WSL could not start Word); names scan of every file

Fri AM · 10 Pitch · Claude Code
Asked: New order: 3 speakers in under 3 min, the 32 s film, then a role play (resident on the phone, mayor on the PC)
Kept: PITCH-INTRO-TEAM4.pdf + Introduction Text - revised.docx (the teammates' text with actor, one number, limits and AI line; 310 words, about 2.2 min); PITCH-ROLEPLAY-TEAM4.pdf with cues and fallbacks; AI counts read from this log at build time
Checked: Visé figures (4 high-priority issues, 3,625 people with no dry route) read from risks.js

AI errors we caught

Thu AM · Labelled EMS AOI01 as "Liège / Vesdre"; ~90% of the mapped flood area is actually the Meuse north of Liège to the NL border
Caught by: Split flooded area by latitude band
Fix: Reframe on the BE-NL-DE border triangle

Thu AM · First result: only 158 buildings in the 2021 flood, presented before plausibility check (official: ~48,000 buildings in Wallonia)
Caught by: Compared with Walloon Gov figure; Annex 2: OBAT undercounts Belgium, EMS = snapshot not peak
Fix: Report as a lower bound with these limits

Thu AM · Web-search summary gave death tolls 31-42 and a 271.5 mm rainfall figure without a primary source
Caught by: Opened the Walloon Government press release
Fix: Use 39 (police, via Gov); rainfall marked "verify with RMI"

Thu AM · Analysis script pointed to the wrong data folder
Caught by: Script crashed on first run
Fix: Path fixed

Thu AM · First team overview PDF cited annex numbers without having read the annexes
Caught by: Annexes unzipped and read
Fix: PDF rebuilt from Annexes 1, 3, 4, 5

Thu midday · Map layer transparency set with a setting the app ignores ("opacity" instead of "fillOpacity")
Caught by: Read the template's app.js before reusing it
Fix: Fixed in the new layer script

Thu PM · v0.7 contained a line with unescaped quotes in content.js, so the policy side's whole content file failed to load (also in the v0.7 build and upload copy)
Caught by: node --check on content.js before filling it in
Fix: Quotes escaped; v0.8 rebuilt; check added to every build step

Thu PM · Easy-read mode made the "In a flood" heading black on navy (contrast about 1.25:1, invisible)
Caught by: Emulator test screenshot
Fix: Heading kept light on the dark screen; re-tested

Thu PM · A CSS layout rule overrode the `hidden` attribute twice (empty card under the loading screen; residents' buttons shown on the policy side)
Caught by: Emulator screenshots
Fix: Explicit `[hidden] { display: none }` rules

Thu eve · The video and card were labelled "Advice: National Crisis Centre" although "Stay away from fast-flowing water" is our plain-words version (the page says "Limit your movements and avoid dangerous areas")
Caught by: Opened the page in all 4 languages to translate it
Fix: Kept the clearer wording (team's choice), source line changed to "Based on National Crisis Centre advice" in all 4 languages

Thu eve · New videos were 3× larger than before: the render added a silent audio track
Caught by: Compared file sizes and streams with ffprobe
Fix: Audio track removed; render scripts now pass --muted

Thu eve · A Haiku test agent reported the 'no stairs' setting as off after the Elderly/disabled switch
Caught by: Read the real value in the emulator's WebView (DevTools protocol): it was on
Fix: False alarm; not changed

Thu eve · Third key number first chosen as '47 buildings flooded in 2021 outside the 100-year zone': a lower bound from about 200 satellite-mapped buildings, too weak to headline
Caught by: Read against the data limits (EMS satellite snapshot, OBAT undercount)
Fix: Replaced by 'residents with no dry walking route to a shelter'

Thu eve · v1.2 code reused two names already in app.js (legend, ACCESS): the whole app would not have loaded
Caught by: node --check before any test
Fix: Renamed; build script runs node --check on every file

Thu eve · v1.2 shelter table and map legend unreadable on a phone (wrapped words, colour swatches separated from their labels)
Caught by: Screenshots at phone size
Fix: One line per cell with sideways scroll; swatch and label kept together

Thu eve · Since the v1.1 style rewrite the laptop's side panel grew past the window and could not be scrolled (body overflow hidden): lower sections such as 'Inform residents' were only reachable through scripted tests
Caught by: v1.2 test measured the panel's scroll container while checking that 'pick Visé' jumps to its card
Fix: Layout row limited to the screen; the panel scrolls; re-tested

Thu eve · The inbox could list the same message twice (two polls in flight both returned it); seen in the keynote recording
Caught by: Frame from the emulator recording showed the DEMO message twice while the relay held one
Fix: app.js skips message ids already listed; APK rebuilt and re-recorded: one message

Thu eve · First draft of brief figure 3 summed per-municipality minimum of the two population sources (128,857) instead of the census total used in the app (138,301)
Caught by: Compared the figure's total with the app's key number
Fix: Figure uses the census-grid sum; script asserts it matches

Thu eve · First draft of brief figure 4 mapped "% of municipality covered by satellite" on shapes already clipped to the satellite area, so every shape looked covered
Caught by: Looked at the rendered map
Fix: Replaced by two part-to-whole bars (area mapped; 2021 buildings inside/outside the model zone)

Thu night · The video element had no poster, so Android's WebView showed its grey play-icon placeholder for ~0.4 s before every video (not visible in desktop browser tests)
Caught by: The owner saw it on their phone; confirmed with an emulator screen recording
Fix: Transparent default poster in the Android wrapper + video hidden until it plays

Thu night · Emulator takes for the film: the soft keyboard covered the screen while typing, and a scripted scroll landed on the empty "Named actor" placeholder
Caught by: Contact sheet of the raw take at every mark
Fix: Values set without focus; scrolling done inside the panel like the app does; re-recorded

Thu night · Recorded clips had white one-frame flashes (WebView repaint) and were shorter than their timestamps (screen recorder writes frames only on change)
Caught by: Frame-by-frame brightness check of the takes
Fix: work/prep_clips.py: constant 30 fps, flash frames replaced by the frame before

Thu night · The owner saw the Elderly/disabled tap "hang" in the film; frame analysis showed the switch flips at once, the pause was the script's wait. A first edit cut jumped into a screen flash
Caught by: Frame differences around the tap; the owner's remark
Fix: Re-recorded take + a short cut in the edit; checked frame by frame

Thu night · Film v2: the Map → Satellite switch showed ~0.3 s of white and blurry tiles (loaded from the network); the owner found it ugly on a projector
Caught by: The owner's review; frame brightness around the tap
Fix: Tiles loaded once off camera before recording; the remaining 0.27 s is cut in the edit

Thu night · The emulator delivered the app's message notification silently (Android flagged it SILENT), so no banner could be filmed
Caught by: Contact sheet of the take + the phone's notification list
Fix: The banner is drawn in the film with the exact title and text the app posts, and the notes say so

Fri AM · The v2 music analysis (coarse steps) put the film's cuts on Floating Cities' off-beat (356 ms after the beat); Remotion's audio also ran 43 ms late; the Send tap was inaudible under music
Caught by: A/B/C test script: beat phase at fine resolution, matched filter on the ping and tap
Fix: Track starts 11 frames in, delay trimmed in mastering, tap 8 dB louder under music; all checks pass

Fri AM · Every map move centred on the whole map, although on phones the panel and briefing card cover its lower half: a picked municipality showed half cut off
Caught by: The owner's phone test; old vs new screenshots
Fix: Moves now use only the visible part (v1.3)

Fri AM · The first timing plan used the 87 s keynote film; the team had already replaced it with the 35 s short film
Caught by: Compared with the team's latest notes (short film in the deck)
Fix: Timing redone with 35 s

Fri AM · The AI emulator tester reported 3 failures that were not app bugs: 'Text my location' loses the text (it appears once a recipient is chosen), the municipality list misses Visé/Esneux/Liège (all 66 are listed, sorted by exposure; Esneux is first), and no shelter found (its test position lies inside the 1-in-500 flood zone, where the app correctly says 'go to an upper floor')

Caught by: Repeated each step by hand: SMS intent on the emulator with a recipient, the picker code, the DEMO Visé location test
Fix: No change needed; demo uses the DEMO Visé location for the shelter

Where the team stopped or corrected the AI

The owner installed each APK build on their own phone, used it like a resident and a policy maker, and sent these corrections back. The AI built; the team decided.

Thu eve · 'Easy read' was a third button on the start screen
Team decided: Group it under 'I live here' as ONE switch for elderly or disabled people
Changed: One switch: big text + read aloud + routes without stairs, also on the 'In a flood' card

Thu eve · The essentials video existed only in English
Team decided: All four languages, chosen once on first open and remembered (crisis: no menus)
Changed: FR/NL/DE/EN videos and cards

Thu eve · The 4-step policy briefing stayed on screen after the last step; the design looked weak
Team decided: It must close; redesign the look
Changed: 'Done ✓' closes it, '▶ Briefing' replays it; new design in the logo colours

Thu eve · The AI rewrote the video lines word for word from the Crisis Centre page
Team decided: Keep the v1.0 wording the team liked ('Stay away from fast-flowing water'), just translated; middle ground
Changed: v1.0 lines back, translated, with a 'based on' source line

Thu eve · The app 'is empty': placeholders instead of numbers; the 6 GB of teammate data was not used
Team decided: Connect the teammate's flood-impact v3 analysis
Changed: Computed key numbers and an impact card per municipality

Thu eve · First wish: data only on a server so it cannot be taken; then the team weighed demo risk
Team decided: For the demo, data in the app; explain the server for a real deployment
Changed: Data built in; the limits and the demo Q&A say how it would run for real

Thu eve · The app showed fewer numbers than the teammate's PC version
Team decided: 'As much of the PC version as possible', size up to ~200 MB is fine
Changed: All 7 tabs of their admin view and its map layers (6.7 MB)

Thu eve · Privacy question: building dots
Team decided: Middle ground: residents see 250 m squares only; policy makers also see buildings after the code
Changed: Built that way, with no count below 5 buildings for residents

Thu eve · On the phone v1 opened very empty: water/electricity/gas tiles had no data and no operator
Team decided: Every feature must work in the demo region; simple, because it is a crisis app
Changed: DEMO statuses loaded at start; operators for all 66 municipalities

Thu eve · —
Team decided: All AI use must be documented, including where the team stopped or corrected the AI
Changed: This section; AI-USE-TEAM4.pdf regenerated

Thu night · A play/pause screen flashed for up to a second before the video
Team decided: Fix it in the best way
Changed: No placeholder at all: navy fades straight into the video

Thu night · 'What to do' (video replay) took one of the three main buttons, although the video already plays at the start
Team decided: Main space for what people act on; replay somewhere secondary
Changed: Messages became the third main button; replay is a small link under 'Official advice'

Thu night · After choosing French, 'Who are you?' was still in English
Team decided: Onboarding in the chosen language
Changed: Start screen in FR/NL/DE/EN

Thu night · The newest APK on the phone said 'demo server not reachable'; water/power/gas empty
Team decided: Everything can be in the APK for the demo
Changed: Built-in DEMO data; live server still wins when connected

Thu night · 'No stairs' box in the shelter panel although chosen in onboarding
Team decided: Remove it: the main space matters
Changed: Follows the onboarding setting; one-line note only when on

Thu night · The grey basemap looked dull
Team decided: Better map visuals, tips from the PC version, still simple
Changed: Topographic map + satellite switch; phone legend folded

Thu night · Title, version and subtitle in the header took map space
Team decided: Keep only role, Help and Switch role
Changed: Slim one-line bar; about 70 px more map on a phone

Fri AM · The AI's pitch plan gave the owner the hook, the phone demo and responsible AI, the teammate only actor and limits
Team decided: Team order: team talks 3 min, then intro, short film, resident demo (owner), policy side on the PC (another teammate)
Changed: Timing redone; responsible AI moves into the team talk

Fri AM · Doubt whether our own prediction model works
Team decided: Do not present it as guaranteed; final wording still to decide
Changed: Angle and limit line drafted (see use log)

Fri AM · The Recommendation box was empty because we have no prediction model
Team decided: Show the teammate's priority issues instead, like their latest version
Changed: v1.4

Fri AM · Owner's idea: a flood phone number per municipality on the offline screen; the AI offered a clearly marked demo number or a brief recommendation only
Team decided: Owner chose: no number in the app (none is real yet); the municipal flood line becomes a recommendation in the brief
Changed: Offline screen built with 112 + sourced utility numbers; recommendation drafted

Fri AM · The AI recommended keeping the film only as a backup for the live demo
Team decided: Keep the 32 s film before the role play
Changed: Role-play script starts after the film

Verification of every number

64,366 buildings in the 1-in-100-year flood zone: Teammate's app_data (EFAS + GHS-OBAT + EMS EMSR518), work/analysis/build_impact.py · recomputed by Independent script check_impact.py (same formulas as their admin view, written again) + sum of the 66 cards · same result: Yes
138,301–139,980 residents in those buildings: Same; population from Census 2021 grid / GHS-POP · recomputed by Same · same result: Yes
56,486 residents in that zone with no dry walking route to a shelter: Same; walking routes on OpenStreetMap paths (teammate's analysis) · recomputed by Same (sum of cards within rounding) · same result: Yes

Limits

• EMS flood maps are satellite snapshots (15 and 17 July), not the peak, and miss water in narrow urban valleys like the Vesdre.
• OBAT undercounts buildings in the Belgian flood areas (Annex 2); OBAT use codes 0/1/2 not yet decoded (check the OBAT PDF).
• EFAS leaves out rivers with a catchment below 500 km², and was run on 1990-2016 data.
• No own GEV fit: the data has no long time series of river flow or rainfall.
• Our own prediction model is not validated.
