walert

Team 4 · European AI Challenge 2026 · 2nd speaker: phone side

In a flood, every minute counts. Nobody should spend them searching three websites. Yet that's exactly what residents in Verviers had to deal with, just to know about their water, electricity and gas.

That's why we built walert: it connects communities, from crisis teams and mayors to every resident, and between municipalities.

walert runs on both phone and computer, and both matter: the computer version shows more data and detail.

ONE APP, TWO SIDES

Policy makers get the full picture: where it flooded in July 2021, where the official 100-year flood zone is, and the gap between the two. walert also shows where the data has gaps: in some areas, the satellite map shows no flooded buildings at all, because satellites miss narrow valleys. So policy makers know what they don't know.

With one verified message, signed with their name, they reach their residents' phones. And in the crisis chat, mayors and crisis teams talk to each other directly: fast, and from the people on the ground.

Residents get it simple: what to do, and above all where to go: the closest possible shelter, by a walking route that avoids the flood zones. Plus the latest messages and essentials like water, power and gas, in one place.

BUILT TO GROW

We built walert on the challenge data for Wallonia: European flood maps from Copernicus and the JRC. Those datasets reach far beyond Wallonia, so walert can grow to all of Belgium, and to the EU.

WITHOUT WALERT

Without it, the risk is silence. In past disasters, the problem wasn't missing big data. It was the small communication between local people: the mayor, the neighbours, the street. walert closes that gap.

CLOSE

walert. Anticiper, coordonner, protéger. Thank you.
